BRAIN Playbook

How to read BRAIN's live market data for Kalshi's 15-minute Bitcoin and XRP rounds.

EDITION 1 · OCTOBER 2026 · BRAINSWATCH.COM

Information and education only. Not financial advice. BRAIN gathers and displays market data; it never tells anyone to trade or what to do with their money.

START HERE

What BRAIN is (and isn't)

BRAIN is an information service. Its software watches public market data around the clock, measures it, and shows you what it sees, live.

✓ What BRAIN does

Gathers prices, trades and order books from the exchanges that matter, plus Kalshi's own market prices.

Runs that data through its models and shows the readings: calls, confidence, flips, whale activity, statistics.

Grades every reading against how the round really settled, and keeps the full record visible.

× What BRAIN doesn't do

It doesn't give financial, investment or trading advice, or recommend anything.

It doesn't tell anyone to buy, sell, hold or place money anywhere. Every decision is yours.

It doesn't know your finances or goals, and it doesn't place trades for members.

How a 15-minute round works

PIECE	WHAT IT MEANS
The line (target)	The price Kalshi sets when the round opens. The question is simply: will the price be above or below this line when the round ends?
UP / DOWN	**UP** = settles above the line. **DOWN** = settles below it.
The market %	Kalshi's own price for a side, read as the crowd's odds. 72% on UP means UP costs about 72¢ and pays $1 if right.
Settlement	Rounds settle on a CF Benchmarks index built from Coinbase, Kraken, Bitstamp, Gemini, Crypto.com, Bullish and LMAX (Gemini isn't in XRP's index). It's an **average over the last 60 seconds**, so a spike in the final seconds barely moves it.
The clock	15 minutes per round. BRAIN reads it at the 4:00 and 8:00 marks and counts down continuously.

⚠ Prediction markets carry a high risk of loss. Everything in this guide explains what BRAIN's screens show. None of it is a suggestion to trade.

THE CORE READING

The calls

A "call" is BRAIN's model reading of which side the data leans toward at a fixed moment. It's a measurement, not an instruction.

Early · 4:00

The first reading, 4 minutes in. More time left means more can change.

Sealed · 8:00

The main reading, locked at 8 minutes. It's the one tracked hardest in the record.

Late call

Only when the sealed reading sat out a coin flip and price later clearly decided.

Two numbers on every call

LINE IN THE BOX	WHAT IT TELLS YOU
BRAIN confidence: 84%	How strongly BRAIN's own blend of readings leans to that side at the lock (price vs the line, order flow, the market's price, candle and trend reads).
Market at lock: 72%	What Kalshi was charging for that side at the exact moment the call locked. Comparing the two shows whether BRAIN and the crowd agreed.
Market agrees · 70%	Kalshi's price for that side right now. "Agrees" means the market still favors BRAIN's side; "disagrees" means it has swung the other way.

Confidence tiers

TIER	CONFIDENCE	NOTES
SUPER	80% or more	Strongest readings. Flow pointing the other way drops it a level.
GOOD	65% or more	Clear lean. Three or more line crosses drop it a level.
WEAK	below 65%	A lean, but close. Near 50/50 BRAIN waits up to 60 seconds before deciding.

★ Tags you may see

80% SETUP: the round matches a filter that won 80%+ on rounds the backtest had never seen. **REVERSAL**: the reading sides with the underdog because flip risk, RSI and momentum line up. **Top traders agree**: verified high-record traders were on the same side (sealed call only, never changes the direction).

THE GAUGES

Reading the round

Around the calls, BRAIN shows the measurements that drive them.

Line crosses: how choppy the round is

CROSSES SO FAR	0	1	2	3	4+
Market favorite won at 8:00	**82.6%**	76.9%	70.9%	67.5%	**62.8%**

From BRAIN's 21-day backtest of 1,992 Bitcoin rounds (1-minute candles). Each extra cross has meant a less settled round. Box labels: CLEAN 0–1 · SOME CHOP 2 · CHOPPY 3+.

RSI (14): momentum

BRAIN shows two ways of computing RSI: **TradingView** (Wilder's standard) and **Webull** (a simple average), plus their average. The starred one is whichever read rounds better in the daily backtest.

METHOD	RSI ABOVE/BELOW 50 MATCHED THE ROUND AT 8:00	AT EXTREMES (70+ / 30–)
TradingView	73.2%	91.9% (160 rounds)
Webull	72.3%	85.0% (453 rounds)

By 8:00 price has often already moved, so RSI partly confirms the move rather than predicting it.

Projected settlement

In the final minute BRAIN averages the index second by second, the way the round settles, and shows what the remaining seconds would need to average to flip it.

Flip radar

A 0–99% estimate of how likely the round is to cross back, from opposing flow, cushion from the line, crosses, order-book walls and pace.

Price-target history

At the bottom of each coin: the last three rounds whose line was this one or closest to it (within 5%), how each ended, and whether BRAIN's sealed reading matched.

LIVE ALERTS

Flip watch, sounds and voice

Alerts describe a change in the data the moment it happens.

Flip watch pills

After a confirmed flip (radar held 70%+ for 3 seconds, or the other side jumped from 30% or less to 45%+), a slim pill floats at the top of the page:

YOU SEE	IT MEANS
▲ UP with call 74%	Price is moving the same way as the call.
▼ DOWN against call 53%	Price is moving against the call (amber text).
HOLDING	The market is back on the call's side.
REVERSAL	The market has turned 60%+ against the call.

Cash-out level note

When the called side reaches 90%+ on the market with 2+ minutes left, the voice says *"Some traders cash out here."* It describes the market; it's not a suggestion.

Late coin flip

With 3 minutes or less left and the market at 40–60%, BRAIN says the round is a real coin flip, and adds "it's flipping" if price just crossed the line.

Sounds and voices

Cash-register cha-ching	A whale **buy** just printed.
Double beep	A whale **sell** just printed.
Chime + spoken call	An early, sealed or late call just locked, with BRAIN's confidence and the market's price.
Voices	Ava, Jenny, Aria, Emma, Michelle, Tony (New York style) or Sarge (drill sergeant). Pick one in Sound settings; sound needs one tap to switch on in each browser session.

BIG MONEY

Whales, exchanges and Trader Radar

Not every big trade matters equally. BRAIN scores each one.

Exchange trust tiers

TIER	EXCHANGES	WHY
Index	Coinbase, Kraken, Bitstamp, Gemini, Crypto.com	They feed the index Kalshi settles on, so their trades move the settlement price directly.
Big global	Binance, OKX, Bybit, Bitfinex, major futures markets	Lead price discovery but don't count toward settlement.
Low-trust	Dropped from BRAIN	Offshore venues with enforcement history or thin volume aren't read at all.

Whale impact score (0–100)

Each big print is sized against live volume using a standard price-impact rule of thumb (impact grows with the square root of size vs volume), weighted by the exchange's tier, then compared with how far price is from the line, the time left and the market's odds. A large buy when the round is a toss-up and price sits right on the line scores high; the same buy when the market is already at 97% scores low.

Sixty seconds after every alert BRAIN checks whether price actually moved the whale's way, and keeps a running hit rate per tier, so the score's accuracy is measured, not assumed.

Trader Radar

Tracks positions that well-known Kalshi traders show publicly, only from accounts locked as the real ones. Lookalike names (M0GS, mogs_, letters from other alphabets) are ignored as impostors. Records are kept by round, hour, day and 7 days.

ACCOUNTABILITY

The record

Every reading is graded against how the round actually settled. Wins and losses both stay on the screen.

Streaks

The current run of right or wrong sealed readings, the best and worst runs, and the last eight results. Wins are gold and losses lavender, never green or red, so they're never confused with UP / DOWN.

Round history

Tap the badge at the top right for today, this week and all time: win rate per call, by tier, and every graded round.

The $100-a-trade example

To show what a reading's record looks like in dollars, BRAIN replays every graded call as if $100 had been placed at the market's price at the moment of the call, held to settlement, with Kalshi's fee and a cent of slippage included.

This is a simulation. It uses past data, assumes fills at the price shown, and doesn't reflect real trading. Past and hypothetical results never predict future results, and nothing here suggests placing $100, or any amount, on anything.

The daily backtest

Every day BRAIN rebuilds 21 days of Bitcoin rounds from public data and replays its rules to check which readings, filters and indicators held up. The screens above use those results (for example the line-cross and RSI tables).

BEFORE YOU GO

Risk, and a quick glossary

Read this. BRAIN is an information and data service. Nothing in BRAIN or in this Playbook is financial, investment, trading, legal or tax advice, a recommendation, or an instruction to buy, sell, hold or trade anything, or to do anything with your money.

Calls, tiers, percentages, badges, alerts, records and backtests describe what the data and models show. They can be wrong, data can be late or missing, and the service can go down without warning.

Prediction markets carry a high risk of loss, including everything you put in. Any decision to trade is yours alone. Only use money you can afford to lose, and talk to a licensed professional if you want advice. BRAIN isn't affiliated with Kalshi, CF Benchmarks or any exchange.

TERM	MEANING
Line / target	The price the round is measured against.
Cushion	How far price is from the line right now.
Line cross	Price moving from one side of the line to the other.
Flow	Whether buyers or sellers are taking more volume across the exchanges.
Order-book wall	A large resting order that can slow price at a level.
Settlement average	The 60-second index average the round settles on.
Whale	A trade large enough to show up against normal volume (the size threshold adapts to the market).
Pass	Your access period to the live dashboard. Passes are one-time and never renew on their own.
