BRAINSWATCH.COM

BRAIN
Playbook

Your guide to every screen on BRAIN: what the calls, gauges, pressure bars and alerts mean, in plain English.

Calls · Pressure · Flip radar · Alerts & voice · Charts · The record

EDITION 3 · OCTOBER 2026 · FOR MEMBERS

Information and education only. Not financial advice. BRAIN gathers and displays market data; it never tells anyone to trade or what to do with their money.

START HERE

01 What BRAIN is, and how a round works

BRAIN watches live market data around the clock for Bitcoin and XRP, measures it, and shows you what it sees, second by second.

✓ What BRAIN does

Reads live prices, trades and order books from major, trusted sources, plus the prediction market's own prices.

Shows its readings live, and grades every one against how the round really ended.

× What BRAIN doesn't do

It never gives financial advice or tells anyone to buy, sell or hold anything.

It doesn't trade for members or know your finances. Every decision is yours.

A 15-MINUTE ROUND IN 30 SECONDS

PIECE	WHAT IT MEANS
The line	The price set when the round opens. The only question: will price finish **above** or **below** it?
UP / DOWN	**UP** ends above the line. **DOWN** ends below it.
Market %	The crowd's odds for a side. 72% on UP means the crowd sees UP as the likelier finish.
The finish	Rounds settle on an average of the **final 60 seconds**, so one last-second spike barely moves the result.
The clock	15 minutes per round. BRAIN makes its readings at the **4:00** and **8:00** marks.

INSIDE THIS PLAYBOOK

The calls & confidence tiers	3	Live flip watch & voice	7
Early vs sealed scorecard	4	Charts	8
Buy & sell pressure	5	The record	9
Flip radar & line crosses	6	Memberships, risk & glossary	10

⚠ Prediction markets carry a high risk of loss. This guide explains what BRAIN's screens show. None of it is a suggestion to trade.

THE CORE READING

02 The calls

A **call** is BRAIN's reading of which side the data leans toward at a set moment in the round. It's a measurement, not an instruction.

Early · 4:00

The first reading, 4 minutes in. More time left means more can still change.

Sealed · 8:00

The main reading, locked at 8 minutes. It's the one tracked hardest in the record.

Late call

Shows up only when the sealed reading sat out a toss-up and price later made a clear move.

TWO NUMBERS ON EVERY CALL

YOU SEE	IT TELLS YOU
BRAIN confidence · 84%	How strongly BRAIN leans to that side when the call locks.
Market at lock · 72%	What the crowd had on that side at the same moment. Side by side, they show whether BRAIN and the crowd agreed.

CONFIDENCE TIERS

SUPER	BRAIN's strongest readings, with a strong record from similar rounds behind them.
GOOD	A clear lean. A choppy round or mixed signals can drop a reading a tier.
WEAK	A lean, but close. Most misses happen here (see the scorecard on page 4).

TAGS YOU MAY SEE

80% SETUP

The round looks like a setup that has been right 80% of the time or more in BRAIN's testing.

REVERSAL

A rare call on the underdog side, made only when the momentum supports a turn. It pays more when right, so it has its own column in the record.

Held the early call

The 8:00 reading wasn't sure enough to switch sides, so it kept the 4:00 side.

Sealed call switched

The 8:00 reading landed on the other side from the 4:00 one. The voice says it out loud.

BY THE NUMBERS

03 4:00 vs 8:00: the scorecard

How each reading scored in BRAIN's test of **1,992 Bitcoin rounds over 21 days** (October 2026), graded against how every round ended.

EARLY · 4:00

68.7%

right overall

SEALED · 8:00

78.4%

right overall

BY CONFIDENCE TIER

TIER	EARLY 4:00	SEALED 8:00
SUPER	**86.1%** (423 rounds)	**89.4%** (603 rounds)
GOOD	70.2% (734)	78.7% (633)
WEAK	57.1% (718)	68.2% (670)

WHAT THE RECORD SHOWS

Later is right more often

By 8:00 price has usually moved, so the sealed reading is right more often. The crowd sees that move too, so its odds are higher by then as well.

Tier beats timing

A SUPER reading at 4:00 has scored nearly as well as one at 8:00, and far better than any WEAK reading.

WEAK means close

Close rounds tend to stay close. 57–68% isn't far from a coin flip.

When 4:00 and 8:00 disagree

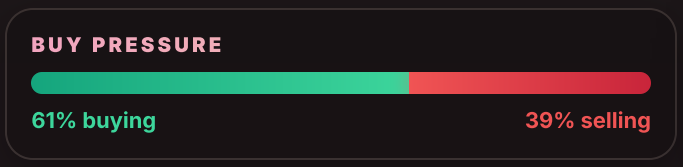

Round history keeps a running count of which reading turned out right when the two landed on different sides.

Past and tested results don't predict future results. The live record on the dashboard is always the latest word.

04 WHO'S PUSHING Buy & sell pressure

Price moves when one side pushes harder. These bars show who is pushing right now: **green is buying**, **red is selling**.

BUY PRESSURE BAR

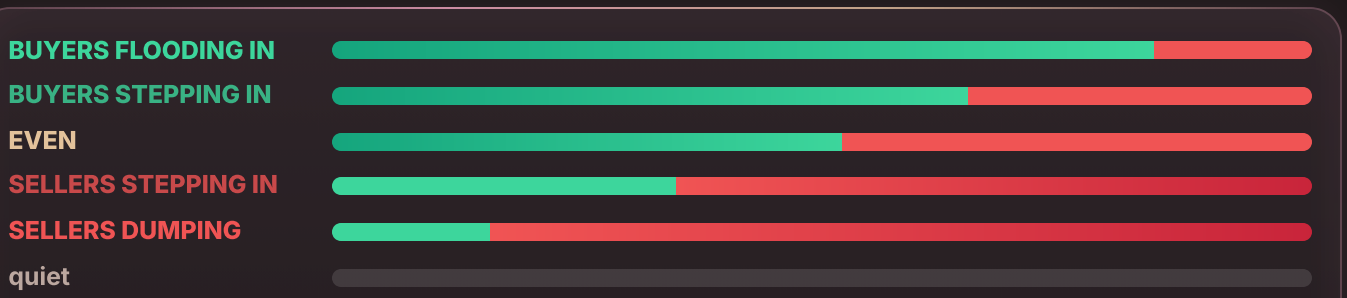

Sits under the live price. It shows how the overall trading splits between buyers and sellers across trusted live sources. A bar that leans hard one way, and stays there, tells you which side has control.

SHORT-TERM PRESSURE METER

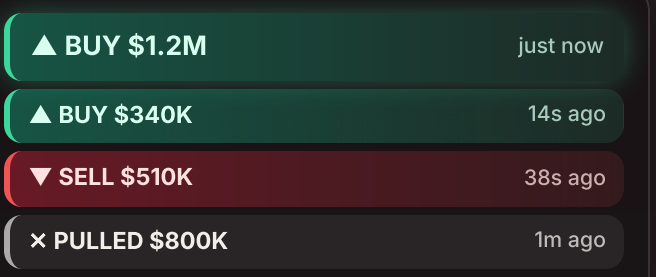

Counts only the **big money** from the last 2 minutes. It's the fastest read on whether large buyers or sellers just showed up.

WHAT THE METER'S TITLE TELLS YOU

The strongest titles need both a lopsided split *and* a lot of money. A lopsided split on small money stays calmer.

WHALE & LIQUIDITY ALERTS

A live feed of large trades and large resting orders. **Bigger money gets a bigger, brighter row**, so a wave of buying or selling jumps out.

Green = bought. **Red** = sold. **White** = an order that was pulled before it filled.

Scroll the box to look back through recent alerts.

THE GAUGES

05 Flip radar & line crosses

Once a call is in, these two gauges answer the big question: **is this round settled, or could it still turn?**

FLIP RADAR

32% WATCH

Why: big selling against the call

Flip radar

A 0–99% read on how likely price is to cross back against the call before the round ends.

It shows **one reason** at a time, the thing that matters most right now: big money moving against the call, or momentum turning.

LOW
0–20%. Holding steady.

WATCH
21–45%. Worth keeping an eye on.

HIGH
46–70%. Real pressure to turn.

CRITICAL
71%+. A turn looks likely.

REVERSAL mode On a reversal call the radar flips around and shows the chance of the cross the call is waiting for: **ON TRACK**, **BUILDING** or **STALLED**.

LINE CROSSES

LINE CROSSES

2 SOME CHOP

▲ 1 up · ▼ 1 down

STABILIZING UP

Last cross 4:10 ago · volatility **LOW**

How many times price has crossed the line this round. Fewer crosses has meant a more settled round:

CLEAN 0–1 | SOME CHOP 2 | CHOPPY 3+

As time passes without a cross, the box moves from **STILL LIVE** to **SETTLING**, **STABILIZING** and **MARKET DECIDED**. Volatility shows how much price has been swinging.

CROSSES BY 8:00	0	1	2	3	4+
Crowd's favorite won	82.6%	76.9%	70.9%	67.5%	62.8%

From the same 1,992-round test. Every extra cross has meant a less settled round.

Projected finish

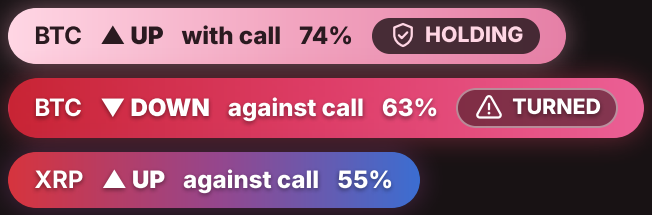

In the final minute, BRAIN tracks the 60-second average the round settles on and shows how far price would have to move to change the result.

LIVE ALERTS

06 Flip watch & voice

Alerts tell you the moment something changes, so you don't have to stare at every number.

FLIP WATCH PILLS

Slim pills float at the top of the screen, but only once an early or sealed call is in.

Pink = the market is holding with the call.
Reddish pink = moving **down** against it.
Reddish blue = moving **up** against it.

TURNED appears when the market has swung clearly (60%+) against the call.

WHAT THE VOICE SAYS

YOU HEAR	WHEN
"New round" + the trend	At the start of a round, with the up / down trend on the timeframes that aren't flat.
The call + a chime	When the early, sealed or late call locks. **"Sealed call switched"** if 8:00 landed on the other side.
Whale alerts	Big buys or sells that matter to the round. Before a call is in, this is almost all the voice says.
"Possible flip up / down"	Only when the flip radar is high or climbing fast *and* price is really moving.
"Flipping" / "flipped"	Only for a real flip: the crowd has moved to the other side at 60/40 or wider.
Minutes left	Only in the last 3 minutes.
"Some traders cash out here"	The call's side is at 90%+ with 2+ minutes left. It describes the market, it's not a suggestion.

Voices

Ava (calm and natural) or **Sarge** (a shouting drill sergeant). Pick one in Sound settings. Each browser needs one tap to turn sound on.

Sounds

A **cha-ching** means a whale **buy** just hit. A **double beep** means a whale **sell**.

The voice is built to stay calm: no repeated lines, nothing every minute, and it never reads out numbers it isn't sure about.

07 SEE IT YOURSELF Charts

The **Charts** tab gives you live candle charts with the most-used indicators drawn right on them, plus a built-in guide to what they mean.

COINS ON THE CHARTS TAB

BTC · ETH · SOL · XRP · DOGE · BNB · HYPE · NEAR

On a phone, pick the coin from the dropdown at the top. The Analysis dashboard (calls, pressure, flip radar) covers BTC and XRP.

WHAT'S ON THE CHART

EMA lines

Smoothed averages of recent price. Price riding above them leans **up**; below leans **down**. When two lines cross, the trend may be changing.

RSI

Momentum from 0 to 100. Above 70 is stretched to the upside, below 30 stretched to the downside. Around 50 is neutral.

MACD

Shows momentum speeding up or slowing down. A cross of its two lines is an early hint the push is changing direction.

Support & resistance

Price zones where buyers (support) or sellers (resistance) have stepped in before. Watch whether price **holds** a zone or gets **rejected** by it.

★ Chart patterns

BRAIN marks well-known shapes on the chart as they form and shows how often each has played out in its testing. Tap **"What do these mean?"** under the chart for a plain-English guide to every line and pattern.

CHART ONLY MEMBERSHIP

Want just the charts? A **Chart Only** membership includes everything on this page for all eight coins, without the BRAIN calls, pressure meters, flip radar or alerts. Every full BRAIN membership already includes the Charts tab.

08 ACCOUNTABILITY
The record

Every call is graded against how the round actually ended. Wins and losses both stay on the screen.

READING THE RESULT CIRCLES

Each circle tells you two things. The **color** is how the round ended (**green = UP**, **red = DOWN**). The **letter** is whether BRAIN was right: a white **W** when it was, an **L** in the circle's color when it wasn't.

W	Called UP, ended UP	W	Called DOWN, ended DOWN
L	Called UP, but ended DOWN	L	Called DOWN, but ended UP

Example run: W W W L W W L W

Streaks & scoreboard

The current run of right or wrong calls, the best and worst runs, and today's record at a glance. Reversal calls get their own column.

Round history

Tap the badge at the top right for today, this week and all time: the win rate for each call and tier, and every graded round.

HOW BRAIN KEEPS LEARNING

After every round, BRAIN checks its calls against the real result. Recent rounds count more than old ones, so it adjusts quickly when conditions change.

Any change has to prove itself on rounds it has never seen before it goes live. If it doesn't make the calls better, it isn't used.

Every result is checked against the market's own final settlement, and any grade that doesn't match is corrected.

BEFORE YOU GO

09 Memberships, risk & glossary

Your membership

Memberships are a **one-time payment** and **never renew** on their own. Buying again adds days on top of the time you have left.

We email you **2 days before** it ends. Current options are on brainswatch.com/pricing. All sales are final.

Please read. BRAIN is an information and data service. Nothing in BRAIN or this Playbook is financial, investment, trading, legal or tax advice, or an instruction to buy, sell, hold or trade anything.

Calls, tiers, percentages, alerts and records can be wrong, and data can be late or missing. Prediction markets carry a high risk of loss. Any decision is yours alone. Talk to a licensed professional if you want advice.

QUICK GLOSSARY

TERM	MEANING
Line	The price the round is measured against.
Call	BRAIN's reading of which side the data leans toward (early 4:00, sealed 8:00, late).
Line cross	Price moving from one side of the line to the other.
Flip	The crowd moving clearly from one side to the other during a round.
Buy / sell pressure	Whether buyers or sellers are doing more of the trading right now.
Whale	A trade or order big enough to stand out from normal trading.
Pulled order	A large order that was canceled before it filled (shown in white).
Reversal	A call on the underdog side, made only when momentum supports a turn.
Volatility	How much price has been swinging lately: low, medium or high.
Settlement	How a round ends: the average price over the final 60 seconds.
